- Selected as one of the Want-to-Work-for Companies of 2012 (organized by Innobiz Organization)

Omni-VM™
Vulnerability Management System

SecuMS™
Vulnerability Assessment and Management System

Omni-VM is a **unified system that monitors the level of management**, while reflecting processes of managing technical vulnerabilities such as OS, DBMS, Network, WAS, Application and SourceCode in connection with various tools for vulnerability checks, approval and human resources systems, etc.

SecuMS automatically monitors system's security vulnerabilities, and offers solutions for discovered issues to provide an overview of vulnerabilities for each server. It provides continuous monitoring of security levels and a true **Constant Security Vulnerability Assessment and Management**.

Server
Protection and
Management
products

Omni-
Account Life

UAC™
Access Control System

UPV
Account

Omni-IM provides integrated account management for different O/S (such as Unix/ Linux/ Windows) based servers and databases. It provides functions for [User Account Management and Integration/ Management for Security Policies](#).

UPV is a server based [Account Management System](#) that centrally manages the accounts policies for Unix/ Linux/ Windows servers.

UAC™

Unified Access Control Management System

UCC™

Unified Connection Control Management System

UCC™

Audit Trail & User Privilege Management System

UAC is a server-based **Access Control System** to centrally manage the access control policies for the different systems of Unix/ Linux/ Windows servers, and prevents any unauthorized access. It is used to improve O/S security and to maximize the administration tasks

UCC is a **User Privilege Delegation and Command Control system including Audit trail function** to ensure accountability of information systems.

Intellectual
Property
Protection

LicenseGuard™

Open-source
License Compliance System

License 
Guard

LicenseGuard extracts the characteristics from distributed open source software's source codes to obtain unique data. The system then compares them with the source codes of the software in development to provide **Similarity & Relevant License Information on the Source Code**.
